(The following section would contain the actual solutions. Due to the length constraint of a single response, I will provide examples showcasing the style and structure of the solutions. This section would occupy approximately 900 words in a real document.)

Example Problem Solutions (Illustrative - replace with actual problems and solutions from the textbook):

Problem 1: Simplify the expression $3x + 5 - 2x + 1$.

Solution:

Combine like terms: $3x$ and $-2x$ are like terms, and 5 and 1 are like terms.

$$3x - 2x = x$$

$$5 + 1 = 6$$

Therefore, the simplified expression is $x + 6$.

Problem 2: Solve the equation $2x + 4 = 10$.

Solution:

Subtract 4 from both sides of the equation:

$$2x + 4 - 4 = 10 - 4$$

$$2x = 6$$

Divide both sides by 2:

$$2x / 2 = 6 / 2$$

$$x = 3$$

Problem 3: Solve the inequality $5x - 10 > 15$.

Solution:

Add 10 to both sides:

$$5x - 10 + 10 > 15 + 10$$

$$5x > 25$$

Divide both sides by 5:

$$5x / 5 > 25 / 5$$

$$x > 5$$

(This pattern would continue for all problems in the Practice Set A, section 1.2. Each problem would have a similar detailed explanation, potentially including diagrams or graphs if necessary. The complexity of the solutions would vary depending on the difficulty of the problems in the original practice set.)

Note: Remember to replace the bracketed information with the correct details for your specific Algebra 1 textbook and answer key. The example problem solutions are merely illustrative and should be replaced with the actual problems and their solutions from the designated practice set. The full 1000-word document would require extensive content based on the specific problems in the textbook.
