Understanding Decimal Multiplication: A Step-by-Step Guide

Before we jump into the worksheet, let's review the fundamental principles of multiplying decimals. The core concept is surprisingly simple: ignore the decimal points initially, perform the multiplication as you would with whole numbers, and then place the decimal point in the final answer.

1. Ignoring the Decimal Point: Multiply the numbers as if they were whole numbers. For example, to multiply 2.5 by 1.2, you would initially calculate $25 \times 12 = 300$.
1. Counting Decimal Places: Count the total number of decimal places in both the numbers you are multiplying. In our example, 2.5 has one decimal place, and 1.2 has one decimal place, for a total of two decimal places.
1. Placing the Decimal Point: In the product (300), count from right to left the number of decimal places you identified in step 2. In this case, two places. This gives us the final answer: 3.00 (or 3).

Let's try another example: 3.14×2.5

1. $314 \times 25 = 7850$
2. 3.14 (two decimal places) + 2.5 (one decimal place) = three decimal places total
3. Therefore, $3.14 \times 2.5 = 7.850$ (or 7.85)

Conquering Decimal Division: A Practical Approach

Decimal division requires a slightly different approach. The key is to eliminate the decimal point in the divisor (the number you're dividing by). This is achieved by multiplying both the divisor and the dividend (the number being divided) by a power of 10.

1. Manipulating the Divisor: Identify the number of decimal places in the divisor. For example, in $12.5 \div 2.5$, the divisor (2.5) has one decimal place.
1. Multiplying to Eliminate the Decimal: Multiply both the divisor and the dividend by 10 (if one decimal place), 100 (if two decimal places), 1000 (if three decimal places), and so on. In our example, we multiply both 12.5 and 2.5 by 10 to get $125 \div 25$.
1. Performing the Division: Now perform the division as you would with whole numbers. $125 \div 25 = 5$

Let's try another example: $7.85 \div 0.25$

1. 0.25 has two decimal places.
2. Multiply both 7.85 and 0.25 by 100: $785 \div 25$
3. Perform the division: $785 \div 25 = 31.4$
